

i-metadataAssetImporter

With i-metadataAssetImporter we have developed a tool which significantly speeds up the simultaneous archiving of varying assets.

Because the interfaces to other software make Cumulus the most liked Digital Asset Management (DAM) system, we continue developing them tailored to the needs of our customers – since Cumulus grows with the requirements of its users.

Even when a picture database has already been installed in an enterprise, additional pictures or other digital assets such as presentations or films are rarely archived one at a time. In most cases several pictures are recorded out of a folder. A time consuming task, above all while for all pictures the metadata such as categories, keywords, color, date, photographer, etc. have to be registered.

available with
Cumulus 7

What are the features of i-metadataAssetImporter?

With i-metadataAssetImporter the archiving process can significantly be accelerated. The repeated entry or the metadata is omitted provided they have already been filled-in in an Excel table. Furthermore, with i-metadataAssetImporter it is possible at a later point in time to add, change metadata to assets already archived, or to adopt contents of another database into Cumulus.

How is i-metadataAssetImporter used?

The tool offers valuable assistance when transferring metadata from other databases or when migrating metadata from other picture archiving systems into Cumulus.

Furthermore the tool supports users at batch scanning and capturing metadata existing in analog form in conventional archives. Those metadata are usually recorded in Excel tables. With i-metadataAssetImporter the metadata together with the assets themselves can be entered into Cumulus in one single step.

interaktion_{gmbh}
Agentur für digitale Integration

Being a well established integrator of digital asset management (DAM) solutions, multimedia and web services, interaktion gmbh implements tailored customer specific solutions. Our services span the full range of consulting during the planning phase, implementing of DAM solutions, creating customer specific interfaces and up to user training.
