i-prefillerPro

With i-prefillerPro we have extended the Cumulus prefiller one step forward. Thanks to "compulsory fields" the tool avoids blank fields in the picture archive. Such the quality of the metadata is massively improved.

Because the interfaces to other software make Cumulus the most liked Digital Asset Management (DAM) system, we continue developing them tailored to the needs of our customers – since Cumulus grows with the requirements of its users.

With Cumulus, pictures and their access rights can be archived, searched and managed efficiently and user friendly. Though it happens again and again that during the archiving and cataloging process certain informations are omitted, respectively certain fields which should be filled in while recording the pictures remain blank due to the hecticness of everyday life. For the editors this means an enormous additional workload because the metadata are not consistently filled in.

WINDOWS MAC OS

ENTERPRISE WORKGROUP

available with Cumulus 7

What are the features of i-prefillerPro?

This gap is now closed by i-prefillerPro. As soon as a user wants to archive assets into Cumulus the i-prefillerPro dialog window opens. Now he must fill in all requested fields; this process can neither be skipped nor canceled. This takes care for a uniform workflow and eases the work of the editors since they only have to check archived assets or exe-cute state changes (e.g. release for publication) respectively.

How is i-prefillerPro used?

The tool simplifies above all the work of the editors since they can exclusively concen-trate on the content of the metadata and no longer have to check whether important metadata are present at all. This massively improves the metadata validity.

Being a well established integrator of digital asset management (DAM) solutions, multimedia and web services, interaktion gmbh implements tailored customer specific solutions. Our services span the full range of consult-ing during the planning phase, implementing of DAM solutions, creating customer specific interfaces and up to user training.
